

# Different Ways to Solve MLE for Cauchy Distribution

*Guanting Wei*

*Sep.17.2018*

## 1 Proof

Density function:

$$f(x; \theta) = \frac{1}{\pi[1 + (x - \theta)^2]} \quad (1.1)$$

The likelihood function:

$$L(\theta) = \prod_{i=1}^n f(X_i; \theta) \quad (1.2)$$

The loglikelihood function:

$$l(\theta) = \ln L(\theta) = \sum_{i=1}^n \ln f(X_i; \theta) = -n \ln \pi - \sum_{i=1}^n \ln[1 + (\theta - X_i)^2] \quad (1.3)$$

Compute the differential of loglikelihood function:

First derivative:

$$l'(\theta) = -2 \sum_{i=1}^n \frac{\theta - X_i}{1 + (\theta - X_i)^2} \quad (1.4)$$

Second derivative:

$$l''(\theta) = -2 \sum_{i=1}^n \frac{1 - (\theta - X_i)^2}{[1 + (\theta - X_i)^2]^2} \quad (1.5)$$

Fisher information:

$$\begin{aligned}
I_n(\theta) &= -E[l''(\theta)] \\
&= 2E \left\{ \sum_{i=1}^n \frac{1 - (\theta - X_i)^2}{[1 + (\theta - X_i)^2]^2} \right\} \\
&= 2nE \left\{ \frac{1 - (\theta - X)^2}{[1 + (\theta - X)^2]^2} \right\} \\
&= 2n \int_{-\infty}^{\infty} \frac{1 - (\theta - x)^2}{[1 + (\theta - x)^2]^2} \frac{1}{\pi[1 + (x - \theta)^2]} dx \\
&= \frac{2n}{\pi} \int_{-\infty}^{\infty} \frac{1 - (\theta - x)^2}{[1 + (\theta - x)^2]^2} \frac{1}{1 + (x - \theta)^2} dx \\
&= \frac{2n}{\pi} \int_{-\infty}^{\infty} \frac{1 - x^2}{(1 + x^2)^2} \frac{1}{1 + x^2} dx \\
&= \frac{2n}{\pi} \int_{-\infty}^{\infty} \left( \frac{x}{1 + x^2} \right)' \frac{1}{1 + x^2} dx \\
&= \frac{2n}{\pi} \int_{-\infty}^{\infty} \frac{1}{1 + x^2} d\left( \frac{x}{1 + x^2} \right) \\
&= \frac{2n}{\pi} \frac{x}{1 + x^2} \frac{1}{1 + x^2} \Big|_{-\infty}^{\infty} - \frac{2n}{\pi} \int_{-\infty}^{\infty} \frac{x}{1 + x^2} d\left( \frac{1}{1 + x^2} \right) \\
&= \frac{4n}{\pi} \int_{-\infty}^{\infty} \frac{x^2}{(1 + x^2)^3} dx \\
&= \frac{4n}{\pi} \int_{\frac{\pi}{2}}^{\frac{\pi}{2}} \frac{(\tan t)^2}{[(1 + \tan t)^2]^3} d \tan t \\
&= \frac{4n}{\pi} \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} (\sin t)^2 (\cos t)^2 dt \\
&= \frac{4n}{\pi} \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} \left( \frac{1}{2} \sin 2t \right)^2 dt \\
&= \frac{4n}{\pi} \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} \frac{1 - \cos 4t}{8} dt \\
&= \frac{n}{2}
\end{aligned} \tag{1.6}$$

## 2 Plot

First, we need to define all functions above. And then We choose 10 random numbers according to density function above using “rcauchy”.

```

f=function(x,theta)1/(pi*(1+(x-theta)^2))

L=function(x,theta){
  prod=1;
  for (i in 1:length(x)){
    prod = prod*(1/(pi*(1+(x[i]-theta)^2)));
  }
  prod
}

```

```

l=function(x,theta){log(L(x,theta))}

l1=function(x,theta){
  sum=0;
  for(i in 1:length(x)){
    sum=sum-2*(theta-x[i])/(1+(theta-x[i])^2)
  }
  sum
}

l2=function(x,theta){
  sum=0;
  for(i in 1:length(x)){
    sum=sum-2*(1-(theta-x[i])^2)/(1+(theta-x[i])^2)^2
  }
  sum
}

set.seed(20180909)
X=rcauchy(10,5)

```

Next, we use those 10 numbers to plot the figure of  $l(\theta)$

```

library("ggplot2")
ggplot(data.frame(x=c(-20,20)),aes(x=x)) +
  stat_function(fun=function(theta) l(X,theta)) +
  labs(x=expression("theta"),y="l")

```

### 3 Newton-Raphson method

According to the result, different initial value may cause different results which are totally different. However, some close number can lead to the same answer. For example, initial value 5,5.5,6,6.5 leads to the same root 5.685418.

```
i=seq(-10, 20, 0.5)
theta_N=matrix(0,1, length(i))
count_N=matrix(0,1, length(i))
for(k in 1:length(i)) {
  theta_N[k]=i[k]
  while (abs(l1(X,theta_N[k]))>0.001&&count_N[k]<10000) {
    temp=theta_N[k]-l1(X,theta_N[k])/l2(X,theta_N[k])
    theta_N[k]=temp
    count_N[k]=count_N[k]+1
  }
}
library(pander)
table_N=rbind(i,theta_N)
rownames(table_N)=c("i","root")
set.caption("Newton-Raphson method")
pander(table_N)
```

## Newton–Raphson method

## 4 Fixed-point iterations

From the results, we can see the smaller initial value causes more stable result.

```
i=seq(-10, 20, 0.5)
